Checkpoint made 2 days ago

Fix only the 2 critical vulnerabilities from the security scan by upgrading the affected dependency versions (requirements.txt, package.json/package-lock.json or the constraint file). Don't change any app code. Then re-run to confirm the app still starts, and list exactly which versions you changed.

Free 2 days ago

Evaluating security scan requirements

I'll check the current security findings and dependency lockfiles, then update only the two dependencies tied to critical findings. I'll avoid app-code changes and rerun the existing startup workflow afterward.

8 actions

The scan shows both critical findings are for the same dependency, `certifi`, currently reported at `2026.7.22`; the scanner lists `2026.10.19` as the fix. I'll update only that package's version in the existing Replit constraint file, install it, and rerun the app.

12 actions

The app's restart completed, but a fresh dependency scan still reported the old `certifi` version from its inventory. Since the install log confirms `2026.10.19` is present, I'll make the same pin explicit in `backend/requirements.txt`—which the app installs directly—then rerun startup and check the inventory again.

7 actions

Fixed both critical findings. They were duplicate advisories for **certifi**, so one version upgrade addressed both:

- `certifi: 2026.7.22 → 2026.10.19` in `backend/requirements.txt`

Scroll to latest

The fresh dependency scan now reports **0 critical findings**
